

Intern Hunt Agent

A personal, 7-agent platform that finds internship leads, tailors your resume per posting, drafts the outreach, and pre-fills applications. It prepares everything — you always press the final Submit or Send.

Open the dashboard

One-tap login (sets a 1-year cookie):

<https://agent-rose-theta.vercel.app/?key=c04ca8d8c1c132c5>

After the first visit, the plain URL works in that browser. Everything below happens on this one page — agent cards on top, tracked rows and leads below.

The 7 agents

Discover	Scans RemoteOK, WeWorkRemotely and HN "Who's Hiring" daily at 09:00 UTC, or on the card's Run now button. Zero matches most days is honest — generic boards rarely carry these roles.
Telegram Intake	DM any job URL to the Telegram bot and it lands as a tracked row, colour-coded: green = Google Form, yellow = known ATS (Lever / Greenhouse / Ashby / Workable), red = manual. The dashboard's Add URL form does the same without Telegram.
Resume Tailorer	On a yellow row, click Tailor: it scrapes the job description and rewrites your resume bullets for it — never inventing facts — then gives you Download PDF (a tailored one-pager) and Copy blurb (a cold message under 200 characters). Takes 30–90 seconds.
Funding Tracker	Watches TechCrunch daily at 09:30 UTC for freshly funded startups — teams that are hiring before they post jobs. Per row: Find contact digs up founders and real published emails (never guessed), and Draft outreach writes a short note referencing the raise.
Mailing Agent	Sends a drafted outreach email to a harvested address and marks the row contacted. Currently off until the Resend email key is configured.
Form Pre-filler	On a green row, click Pre-fill form, then Open pre-filled form: your saved answers are already typed into the Google Form. You review, attach the resume file, and submit.
WhatsApp Watcher	A small bridge on your PC reads the job groups and channels you follow; matching posts become tracked rows or leads and ping you on Telegram. Start it with <code>cd D:\Intern\intern-agent\bridge; npm start</code> and keep the window open — it only sees posts made while running.

The flow, end to end

A posting arrives (any source above) » tracked row on the dashboard » **Tailor** » tailored PDF + blurb » **Pre-fill form** or **Draft outreach** » **you submit**. Each row has a status dropdown (new / applied / skipped...) so the dashboard doubles as your application tracker.

Ground rules it never breaks

- **Nothing is ever auto-submitted or auto-sent.** Every application and email has a human click behind it.
- **Emails are found, never fabricated.** An address is only used if it was literally published on the company's own site.
- **Resume facts are preserved.** Tailoring reorders and rephrases your real bullets; it cannot invent experience or numbers.
